fly.db0

Bioconductor annotation BASE package

Description

Welcome to the fly.db0 annotation Package. This is an organism specific package and is ONLY meant as a means for distributing the latest Annotation Databases needed by the sqlForge code inside of AnnotationDbi to produce normal Annotation Packages.

Users are warned that the direct calling of the database inside this package could be a very bad idea depending on what you are planning to do. This is because the schema for the databases in this package COULD CHANGE AT ANY TIME. Because of this, no schemas are provided.

For access to more consistent schemas, please use the sqlForge package to generate a normal chip or organism based annotation package, or else use one of these other annotation packages directly.

Examples

```
## Not run:
# You should never have to use this package for anything directly.
# Its purpose is only to put the latest databases into a consistent
# location so that the sqlForge code can build annotation packages from
# them. All you should ever have to do is use BiocManager::install()
# to obtain this package and then use the appropriate wrapper functions from
# AnnotationDbi. Some examples Include:
# makeHUMANCHIP_DB(), makeMOUSECHIP_DB(), makeRATCHIP_DB(),
# makeFLYCHIP_DB(), makeYEASTCHIP_DB(), makeARABIDOPSISCHIP_DB()

## End(Not run)
```
